Software Engineering - Sheet (1)

1- generic Software Product are Standalone systems, sold to any Customer like graphics Programs, Management tools Specifications are owned by the software developer.

⇒ Custom software development is a Software design to meet a specific Customer needs, specifications are owed by the customer, like embedded Control systems and Banking systems

2- Software engineering ⇒ is Concerned with a Part of the software Process, it's a Part of system engineering
System engineering ⇒ Concerned with all aspects of Computer based system development software & hardware

3- Coping with increasing diversity and demands, reduced delivery times and delivering trustworthy software.

4- Lack of understanding of the Project scope
unclear requirements, Complexity and Poor tool Support

5- Heterogenity, as systems could be operating as distributed systems
* Buisness & social change as fast changes that software should cope with
* Security & trust

6- There is 4 Processes:

① Specification → Defining what the system should do
② Design & Implementation → Defining the organization of the (development) system & implementing it
③ Validation (verification + validation)
Checking the systems makes what the customer needs
④ Evolution ⇒ Changing the system in reponse to changing the customer needs.

7- Choose

(a) b - Theories, methods and tools for Professional Software
(b) c - Hardware maintenance
(c) c - Software maintenance costs can be higher than initial development costs
(d) c - dependability and security
