1.The 'Scrum master' is a facilitator who arranges daily meetings, tracks the backlog of work to be done, records decisions, measures progress against the backlog and communicates with customers and management outside of the team

q22 fel emt7an el tany

4. Individual who is responsible [illegible]
   a. Project manager
   b. Product owner
   c. Scrum Master
   d. Organization manager

5. If the system to be developed can be developed with a small co-located team
   a. We properly need to use a plan-driven method
   b. We can use an agile or a plan-driven method without any preference
   c. We should use an agile method
   d. We properly need to use an agile method

6. While Scaling up agile methods to large systems
   a. more focusing on co-located team communication is needed
   b. cross-team communication mechanisms have to be designed and used
   c. focus on team communication is done as it is applied in small systems
   d. focus on co-located team communication is an essential customer requirement

4. As large organizations have members of wide range of skills and abilities
   a. Agile methods are not the best fit for these skills and abilities
   b. Agile methods are the best fit for these skills and abilities
   c. Agile methods can be used to improve their skills and abilities
   d. Agile methods are a must for these types of skills

5. Plan-driven processes are used where
   a. the project is of small or mid-size
   b. the system is not critical application
   c. all of the process activities are planned in advance
   d. some of the activities are planned in advance

6. The phases of Waterfall model are:
   a. requirements analysis, design, Implementation, testing, and maintenance
   b. analysis, system design, software design, Implementation, testing
   c. requirements analysis, software design, implementation, and unit testing
   d. requirements analysis, design, Integration and system testing, and maintenance

7. The common types of reusable software include
   a. All open source modules
   b. Documented applications that can be easily updated
   c. Collections of objects that are developed as a package to be integrated with a component fra
   d. Ready-made applications that can be called using customized API

8. A prototype can be used in
   a. Requirements engineering process only
   b. Design process only
   c. Resting process only
   d. Requirements engineering, design process, and testing process

9. Models that may be built for existing system for documentation
   a. could be incomplete but should be accurate
   b. could be incomplete and inaccurate
   c. should be complete but could be inaccurate
   d. should be complete and accurate

10. Modeling user-system interaction and system-to-system interaction could be represented by
   a. Activity diagram and Sequence
   b. Use case and State diagram
   c. Class diagram and Sequence diagram
   d. Use case and Sequence diagram

11. The dynamic behavior of a data-driven-system could be properly modeled using
   a. State diagram
   b. Class diagram and Sequence diagram
   c. Activity diagram and Sequence diagram
   d. Use case diagram and Activity diagram

Requirements Validation Checks:

Validity Consistency Completeness Realism Verifiability

Requirements validation techniques:
requirement reviews, prototyping, testcase generation

Agile Manifesto:
1.Individuals and interactions over processes and tools
2.Working software over comprehensive documentation
3.Customer collaboration over contract negotiation
4.Responding to change over following a plan

13. [illegible]
14. State diagrams are used to model a system's behavior in response to
    a. internal events only
    b. internal or external events
    c. external events only
    d. internal data and external events
15. In Requirements validation process, we should check
    a. Validity, Consistency, Portability, and Testability of requirements
    b. Reliability, Consistency, Completeness, Applicability, and Testability of requirements
    c. Reliability, Consistency, Completeness, Realism, and Verifiability of requirements
    d. Validity, Consistency, Completeness, Realism, and Verifiability of requirements
16. Requirements validation techniques include
    a. Requirements reviews, Test-case generation, or Interviews
    b. Requirements reviews, Interviews, or Test-case generation
    c. Requirements reviews, Prototyping, or Interviews
    d. Requirements Test-case generation, Prototyping, or Interviews
17. Requirements Validation means
    a. Are the requirements realistically testable?
    b. Are the requirements covering all customers' needs?
    c. Are the requirements fulfilling what the customers need?
    d. Are the requirements realistically applicable?
18. Requirements Adaptability means
    a. Are the requirements could be changed without a large impact on other requirements?
    b. Are the requirements realistically testable?
    c. Are the requirements fulfilling what the customers need?
    d. Are the requirements realistically applicable?
19. In Agile development methods
    a. Program specification, design and implementation are completely separated
    b. Program specification, design and implementation are inter-leaved
    c. Program specification, design and implementation are fully planned in advance
    d. Program specification and design are interleaved but implementation is not
20. In Agile development methods
    a. building complete documentation is important than having working code
    b. building complete documentation before having working code
    c. building minimal documentation but focusing on working code
    d. building complete documentation before delivering any increment
21. Agile manifesto states:
    a. We have come to value "customer collaboration"over "contract negotiation"
    b. We have come to value "contract negotiation" over "customer collaboration"
    c. We have come to equally value both "customer collaboration" and "contract negotiation"
    d. We have come to value "customer collaboration" but not "contract negotiation"
22. Agile method is applicable for
    a. large size product with many non-localized teams
    b. mid-sized product regardless of customers involvement in developing phases
    c. large size product with many non-localized teams with customer involvement
    d. small and mid-sized product with clear commitment of customer involvement
23. In Extreme programming
    a. All tests must be run for every build
    b. Increment is accepted if this increment test only run successfully
    c. Each increment has its own test, but All tests must be run only once at the end
    d. Test could be performed while delivering the increment to the user

24. Some of the metrics used in measuring process legal are
   a. time taken to complete the process, number of developed
   b. time taken to complete the process, total effort in person days
   c. time taken in process analysis, number of resources required, number of testing processes
   d. time taken to maintain than it does to develop

25. a. True b. False

26. Which of the following could be reasonable a "Release
   a. Select stories, Break down to tasks, Plan release, Develop/integrate/test, Release software, Evaluate system,
   b. Select stories, Develop/integrate/test, Release
   c. Select stories, Break down to tasks, Develop/integrate/test, Release
   d. Select stories, Plan release, Develop, Release Software, Evaluate system,

27. In extreme programming, "Refactoring" ...
   a. is not expected to be used in most of the projects due to its overhead
   b. will keep the code more complex and well documented
   c. is expected to be used by developers as soon as possible code improvements are found
   d. is the process of decompose the code to small objects

28. In extreme programming, each user story
   a. will be implemented as an atomic unit
   b. will be analyzed and then the team will decide to implement it or not
   c. will be only checked by the development team to decide its applicability
   d. will be broken down into tasks and these tasks are the basis of implantation schedule

29. In Test-driven development
   a. Tests are designed and executed after implementation
   b. Tests are written as programs and designed before code
   c. Tests are run manually
   d. Tests are run after coding using a set test data

30. System requirements are structured document setting out detailed descriptions of the system's functions, services and operational constraints
   a. True b. False

31. Non-functional requirements are
   a. constraints on the services or functions offered by the system such as timing constraints, constraints on the development process, standards
   b. statements of services the system should provide, how the system should react to particular inputs and how the system should behave in particular situations
   c. constraints on the system from the domain of operation
   d. functions that should be implemented to fulfill user requirements

32. A single non-functional requirement
   a. will generate a single functional requirement to provide one system service
   b. may generate several related functional requirements that define system services
   c. may generate many related non-functional requirements
   d. will be mapped to several system services that required by customers

33. Metrics for specifying "Reliability" could be
   a. Event response time, Rate of failure occurrence, Availability
   b. Event response time, Probability of unavailability, Usability
   c. Event response time, Rate of failure occurrence, Usability
   d. Mean time to failure, Rate of failure occurrence, Availability

34. The common activities in all Requirements Engineering processes are
   a. Requirements elicitation, analysis, validation, specification
   b. Requirements elicitation, analysis, validation, management
   c. Requirements elicitation, analysis, documentation, management
   d. Requirements analysis, validation, documentation, management

35. Ethnography is a technique used in
   a. Requirements validation
   b. Requirements specification
   c. Requirements discovery elicitation
   d. Requirements classification

24.Process metrics:
1.Time taken for process activities to be completed
2.Resources required for processes or activities
3.Number of occurrences of a particular event
E.g. Number of defects discovered.

25.software cost more to maintain than to develop
True

26.extreme prog release cycle:
select stories->break down to tasks->plan release->develop/integrate/test->release software->evalute system

Ethnography is effective for understanding existing processes but cannot identify new features that should be added to a system.

Good Luck
